Rows: EBITDA-margin adjustment (pp) over the WHOLE 2027+ path (column E = resulting LT margin). Columns: revenue/GW multiplier over the WHOLE 2027+ path (top row) — the bottom row shows the equivalent 2030 level (LT = 14.0 x mult). Base 2030 = 13.0 s/s BELOW management's floor for new contracts (15-16): 1.9 GW legacy at 11 + 6.1 GW new at 15.5 would blend to ~14.

11 bn/GW | 12 bn/GW | 13 bn/GW | 14 bn/GW | 15 bn/GW | 16 bn/GW

Sensitivity | replacement life (years, columns) x replacement cost (% of build, rows) — US$ / share (data table)

Replacement is what the Street rarely charges explicitly: at 6 years / 80% a mature fleet consumes ~$5.3bn per GW-year (≈ D&A). Longer life = re-contracting old GPUs (A100/H100 still rented in year 9) without replacing them — but the 7-10-year columns keep full pricing on old GPUs (DB 2025-06-16: 50-75% of ASP in years 5-6), so they are the UPPER BOUND, not a case.

Steady-state unit economics per GW (column CY35E) — the arithmetic behind the DCF

Revenue per billable GW (US$ bn / GW-year)	14,00
EBITDA per GW (US$ bn)	8,68
D&A per GW (US$ bn)	5,00
SBC per GW (US$ bn)	0,28
Tax per GW = (EBITDA − D&A − SBC) x tax rate (US$ bn)	0,71
Operating cash per GW before capex = EBITDA − SBC − tax (US$ bn	**7,69**
Build cost per GW (US$ bn)	40,00
Replacement per GW-year, mature fleet = build x replacement % ÷ life	5,33
Replacement of 1 NEW GW, annual equivalent (sinking fund: first swa	4,15
FCF per GW-year of 1 new GW, no growth = operating cash − equ	**3,54**
Cash yield on build cost (FCF ÷ build)	8,8%
Gross payback of the build = build ÷ operating cash (years)	5,2 yrs

Value of 1 GW in perpetuity at WACC = FCF ÷ WACC (US$ bn)	35,39
NPV of 1 new GW = value − build (US$ bn) — negative = each GW	**(4,61)**
Break-even revenue/GW (NPV = 0) at the same margin, life and repla	14,97

Break-even: (EBITDA − SBC) x (1 − t) + D&A x t − equivalent replacement = build x WACC. Compare with the marks: installed book ~11, management's floor for new contracts 15-16 (= the break-even), short-dated ~40. A MATURE fleet replaces ~fleet ÷ life per year (memo row) — that is what the DCF charges from 2032.

Memo outside the DCF | implied net debt, interest, net income and EPS (no equity raised after 2026)																						
Net debt at year-end (US$ m)			18.488	45.362	80.395	117.183	150.574	184.713	201.373	218.314	228.025	235.275	235.677	228.895	216.954	213.104	207.621	201.942	194.953	181.394	160.342	146.415	129.669

The 'Capstone estimates (house model)' table on the wiki page (_wiki/CRWV.md) is transcribed from this block (CY24A-CY30E). Thesis-drift rule: when a number changes, move the old one to the page's Changelog.

Reading the model: at the current price the DCF is a bet on revenue per GW and on replacement — a GW costs ~$40bn and generates ~$8-9bn of EBITDA a year; with replacement every 6 years the unlevered return sits near the WACC. The revenue/GW x margin grid is the answer.
